$$\bullet S_{CDT} = k_3 N_3 - k_0 N_0$$

Use Monte Carlo techniques to evaluate expectation values.

Well described by

$$S_{eff}[V] = \int dt \left(c_0 \frac{\dot{V}^2}{V} - c_1 V \right),$$
with $c_0, c_1 > 0.$

• If we evaluate Euclidean Einstein-Hilbert action $\int d^3x \sqrt{g}(-R+2\Lambda)$ on spherical cosmology $ds^2 = dt^2 + V(t)d\Omega^2$,

$$S_{EH}[V] = -\kappa \int dt \left(\frac{\dot{V}^2}{V} - 2\Lambda V\right).$$
(1)

Minus-sign difference!

If we evaluate Euclidean Einstein-Hilbert action $\int d^3x \sqrt{g}(-R+2\Lambda)$ on spherical cosmology $ds^2 = dt^2 + V(t)d\Omega^2$,

$$S_{EH}[V] = -\kappa \int dt \left(\frac{\dot{V}^2}{V} - 2\Lambda V\right).$$
(1)

Minus-sign difference!

• Can we understand why we get S_{eff} and not S_{EH} ?

If we evaluate Euclidean Einstein-Hilbert action $\int d^3x \sqrt{g}(-R+2\Lambda)$ on spherical cosmology $ds^2 = dt^2 + V(t)d\Omega^2$,

$$S_{EH}[V] = -\kappa \int dt \left(\frac{\dot{V}^2}{V} - 2\Lambda V\right).$$
(1)

Minus-sign difference!

- Can we understand why we get S_{eff} and not S_{EH} ?
- S_{eff} is bounded below (for fixed 3-volume), S_{EH} is not.

■ Euclidean EH action in 2+1D (and 3+1D) is unbounded from below.

- Euclidean EH action in 2+1D (and 3+1D) is unbounded from below.
- Metric in proper-time form, $ds^2 = dt^2 + g_{ab}(t, x)dx^a dx^b$. Then

$$S_{EH} = \kappa \int dt \int d^2 x \sqrt{g} \left(\frac{1}{4} \dot{g}_{ab} \mathcal{G}^{abcd} \dot{g}_{cd} - R + 2\Lambda \right)$$
(2)

where \mathcal{G}^{abcd} is the Wheeler-DeWitt metric,

$$\mathcal{G}^{abcd} = \frac{1}{2} \left(g^{ac} g^{bd} + g^{ad} g^{bc} \right) - g^{ab} g^{cd}. \tag{3}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

(日) (日) (日) (日) (日) (日) (日) (日)

 Indefinite metric! Positive definite on traceless directions, negative definite on trace/conformal direction in superspace.

- Euclidean EH action in 2+1D (and 3+1D) is unbounded from below.
- Metric in proper-time form, $ds^2 = dt^2 + g_{ab}(t, x)dx^a dx^b$. Then

$$S_{EH} = \kappa \int dt \int d^2 x \sqrt{g} \left(\frac{1}{4} \dot{g}_{ab} \mathcal{G}^{abcd} \dot{g}_{cd} - R + 2\Lambda \right)$$
(2)

where \mathcal{G}^{abcd} is the Wheeler-DeWitt metric,

$$\mathcal{G}^{abcd} = \frac{1}{2} \left(g^{ac} g^{bd} + g^{ad} g^{bc} \right) - g^{ab} g^{cd}. \tag{3}$$

- Indefinite metric! Positive definite on traceless directions, negative definite on trace/conformal direction in superspace.
- CDT is a (well-defined) statistical system, therefore it better be described by a bounded action!
- Need some alternative to EH to compare too.

Adding higher order *R*-terms to S_{EH} will not help: to get a stable minimum we need a non-local action or we have to break general covariance.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- Adding higher order *R*-terms to S_{EH} will not help: to get a stable minimum we need a non-local action or we have to break general covariance.
- CDT seems to have a preferred time-slicing á la Hořava-Lifshitz. If we require our action to be invariant only under foliation-preserving diffeomorphisms, the most general allowed ultralocal kinetic term is

$$\mathcal{G}_{\lambda}^{abcd} = \frac{1}{2} \left(g^{ac} g^{bd} + g^{ad} g^{bc} \right) - \lambda g^{ab} g^{cd}. \tag{4}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 (7)

• In CDT: K_{ab} has support on the edges and is proportional to the number of tetrahedra N(e) connected the edge e.

Measure correlation functions $\langle N(e)N(e')\rangle - \langle N(e)\rangle\langle N(e')\rangle \approx (\mathcal{G}_{\lambda} + \Delta)^{-1}.$
