- 2D Dynamical triangulations
- Moduli parameters for torus triangulations
- Results for pure gravity
- Coupling to c = -2 matter
- Conclusions and outlook

Classical pure gravity in 2d is not very interesting

$$S_{
m EH}[g] = \int d^2 x \sqrt{g} (\kappa R + \mu) = 4\pi (1-g)\kappa + \mu \int d^2 x \sqrt{g}.$$
 (1)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Classical pure gravity in 2d is not very interesting

$$S_{\rm EH}[g] = \int d^2 x \sqrt{g} (\kappa R + \mu) = 4\pi (1-g)\kappa + \mu \int d^2 x \sqrt{g}.$$
 (1)

We can write down formal partition function

$$Z = \sum_{g=0}^{\infty} e^{4\pi(g-1)\kappa} \int \frac{\mathcal{D}g}{\operatorname{vol}(Diff)} e^{-\mu V[g]}$$
(2)

$$Z = \int \frac{\mathcal{D}g\mathcal{D}X}{\operatorname{vol}(Diff)} \exp\left(-S_m[X,g] - \mu V[g]\right)$$
(3)

 Bosonic string in *d*-dimensional Euclidean space (a conformal field theory with central charge c = d)

$$S_m[X,g] = \int d^2 x \sqrt{g} g^{ab} \partial_a X^i \partial_b X^j \delta_{ij} \tag{4}$$

How to tackle this partition function?

$$Z = \int \frac{\mathcal{D}g\mathcal{D}X}{\operatorname{vol}(Diff)} \exp\left(-S_m[X,g] - \mu V[g]\right)$$
(5)

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

How to tackle this partition function?

$$Z = \int \frac{\mathcal{D}g\mathcal{D}X}{\operatorname{vol}(Diff)} \exp\left(-S_m[X,g] - \mu V[g]\right)$$
(5)

Non-critical string approach: fix conformal gauge  $g_{ab} = e^{2\beta\phi}\hat{g}_{ab}(\tau)$  with Liouville field  $\phi$  and moduli  $\tau$ .

How to tackle this partition function?

$$Z = \int \frac{\mathcal{D}g\mathcal{D}X}{\operatorname{vol}(Diff)} \exp\left(-S_m[X,g] - \mu V[g]\right)$$
(5)

- Non-critical string approach: fix conformal gauge g<sub>ab</sub> = e<sup>2βφ</sup> ĝ<sub>ab</sub>(τ) with Liouville field φ and moduli τ.
- Requiring the partition function to be independent of ĝ leads to the Liouville partition function

$$Z = \int d\tau \, \mathcal{D}_{\hat{g}} \phi \, \mathcal{D}_{\hat{g}} X \, J[\hat{g}] \exp\left(-S_L[\hat{g}, \phi] - S_m[X, \hat{g}]\right) \tag{6}$$

$$S_{L}[\hat{g},\phi] = \frac{1}{4\pi} \int d^{2}x \sqrt{\hat{g}} \left(\phi \Delta \phi + Q \hat{R} \phi + \mu e^{2\beta\phi}\right)$$
(7)

$$Q = \sqrt{\frac{25-d}{6}} = \frac{1}{\beta} + \beta \tag{8}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Take flat metric on the torus

$$\hat{g}_{ab}(\tau, x) = rac{1}{\tau_2} \begin{pmatrix} 1 & \tau_1 \\ \tau_1 & \tau_1^2 + \tau_2^2 \end{pmatrix}$$
 (9)

and fix volume  $\delta \left( V - \int d^2 x \sqrt{\hat{g}} e^{2\beta\phi} \right)$ 

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Take flat metric on the torus

 (9)

and fix volume  $\delta \left( V - \int d^2 x \sqrt{\hat{g}} e^{2\beta \phi} \right)$ 

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Then

$$Z^{g=1}(V) \propto \int rac{d^2 au}{ au_2^2} F( au)^{c-1}$$

$$F(\tau) = \tau_2^{-1/2} e^{\pi \tau_2/6} \prod_{n=1}^{\infty} \left| 1 - e^{2\pi i n \tau} \right|^{-2}.$$

Main goal of this project: Test whether this distribution of moduli also appears in discretized gravity, i.e. dynamical triangulations.

# 2D dynamical triangulation

 Discretize the pure gravity partition function (d = c = 0)

$$Z(\mu) = \int \frac{\mathcal{D}g}{\operatorname{vol}(Diff)} e^{-\mu V}$$
$$\rightarrow \quad Z(\mu) = \sum_{T \in \mathcal{T}} \frac{1}{C_T} e^{-\mu N}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# 2D dynamical triangulation

 Discretize the pure gravity partition function (d = c = 0)

$$egin{aligned} & Z(\mu) = \int rac{\mathcal{D}g}{ ext{vol}(Diff)} e^{-\mu V} \ & 
onumber \ & Z(\mu) = \sum_{T\in\mathcal{T}} rac{1}{C_T} e^{-\mu N} \end{aligned}$$

► Z(µ) is the generating function of the fixed volume partition function Z(N).

$$Z(\mu) = \sum_{N=0}^{\infty} Z(N) e^{-\mu N}$$
(10)

Z(N) just counts inequivalent triangulations with N triangles

# 2D dynamical triangulation

 Discretize the pure gravity partition function (d = c = 0)

$$egin{aligned} & Z(\mu) = \int rac{\mathcal{D}g}{ ext{vol}(Diff)} e^{-\mu V} \ & 
onumber \ & Z(\mu) = \sum_{T\in\mathcal{T}} rac{1}{C_T} e^{-\mu N} \end{aligned}$$

► Z(µ) is the generating function of the fixed volume partition function Z(N).

$$Z(\mu) = \sum_{N=0}^{\infty} Z(N) e^{-\mu N}$$
(10)

Z(N) just counts inequivalent triangulations with N triangles▶ For genus g:

$$Z^{(g)}(N) \sim N^{(5g-7)/2} e^{\mu_0 N} \quad \text{as } N \to \infty.$$
 (11)

Fixed volume partition function

$$Z(N) \propto \sum_{T \in \mathcal{T}(N)} \frac{1}{C_T} = \frac{1}{N!} \sum_{\text{labelled } T \in \mathcal{T}(N)} 1.$$
(12)

・ロト・日本・モト・モート ヨー うへで

Fixed volume partition function

$$Z(N) \propto \sum_{T \in \mathcal{T}(N)} \frac{1}{C_T} = \frac{1}{N!} \sum_{\text{labelled } T \in \mathcal{T}(N)} 1.$$
 (12)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

► If we have a method of producing random triangulations with uniform probability in T we can approximate expectation values of observables.

Fixed volume partition function

$$Z(N) \propto \sum_{T \in \mathcal{T}(N)} \frac{1}{C_T} = \frac{1}{N!} \sum_{\text{labelled } T \in \mathcal{T}(N)} 1.$$
 (12)

- If we have a method of producing random triangulations with uniform probability in T we can approximate expectation values of observables.
- ▶ Monte Carlo simulation: start with any triangulation with *N* triangles and genus *g*. Perform a large number of flip moves on random edges. Resulting triangulation will have desired property.

Fixed volume partition function

$$Z(N) \propto \sum_{T \in \mathcal{T}(N)} \frac{1}{C_T} = \frac{1}{N!} \sum_{\text{labelled } T \in \mathcal{T}(N)} 1.$$
 (12)

- ▶ Monte Carlo simulation: start with any triangulation with *N* triangles and genus *g*. Perform a large number of flip moves on random edges. Resulting triangulation will have desired property.

• Use this to measure moduli distribution in  $Z^{g=1}(N)$ . More precisely we want to measure the fraction  $P(\tilde{\tau}_2)\Delta\tilde{\tau}_2$  of randomly generated triangulations with  $\tau_2$  between  $\tilde{\tau}_2$  and  $\tilde{\tau}_2 + \Delta\tilde{\tau}_2$ .

How do we determine τ for a metric g<sub>ab</sub> on the torus? Find periodic coordinates x<sup>1</sup>, x<sup>2</sup> ∈ [0, 1) such that ds<sup>2</sup> = Ω<sup>2</sup>(x)ĝ<sub>ab</sub>dx<sup>a</sup>dx<sup>b</sup> for ĝ<sub>ab</sub> constant.

# Measurement of $\tau$ on triangulation

- ► Recipe:
  - Find 2 curves  $\gamma_j$  that generate fundamental group.
  - Find the 2-dimensional kernel of  $\Delta$ .
  - Determine basis  $\alpha_j$  such that  $\int_{\gamma_i} \alpha^i = \delta_j^i$ .

• Compute 
$$\tau = -\frac{\langle \alpha^1, \alpha^2 \rangle}{\langle \alpha^2, \alpha^2 \rangle} + i \sqrt{\frac{\langle \alpha^1, \alpha^1 \rangle}{\langle \alpha^2, \alpha^2 \rangle} - \left(\frac{\langle \alpha^1, \alpha^2 \rangle}{\langle \alpha^2, \alpha^2 \rangle}\right)^2}.$$

### Results for c = -2 dynamical triangulations

Smaller *c* means more regular. Data fits theory "perfectly" already at N = 8000:

For example we measure P(τ₂ < 1.5) = 0.64067 ± 0.00014, while Liouville theory predicts</p>

$$P(\tau_2 < 1.5) = \frac{\int_{\tau_2 < 1.5} \frac{d^2 \tau}{\tau_2^2} F(\tau)^{c-1}}{\int \frac{d^2 \tau}{\tau_2^2} F(\tau)^{c-1}} = 0.640648\dots$$

- Conclusions
  - We checked numerically for c = 0 and c = -2 that the measure defined by dynamical triangulations on moduli space (as  $N \to \infty$ ) coincides with the measure from Liouville theory. This piece of evidence may be added to an extensive list of connections found previously.

<sup>1</sup>see e.g. TB, 'The effective kinetic term in CDT', arXiv:1110.5158  $= \times = -9$  < > = -9

  - The results also indicate that discrete differential geometry can work even for very wild triangulations.
- Outlook
  - All techniques I discussed can be extended to higher genus. Actually we already have data for genus 2 (in terms of "period matrices"). But we have no theory! String theorists: please compute the moduli-integrand for the two-loop non-critical string partition function.

<sup>&</sup>lt;sup>1</sup>see e.g. TB, 'The effective kinetic term in CDT', arXiv:1110.5158  $\equiv \times = -9$  QC
